- 5 – Geographic Knowledge Infrastructure
- 6 – Conclusion and research agenda

Michel Serres

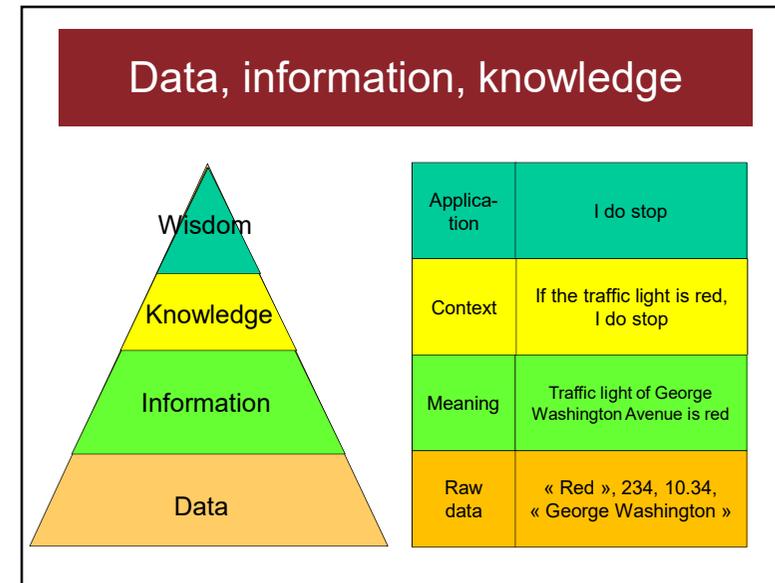

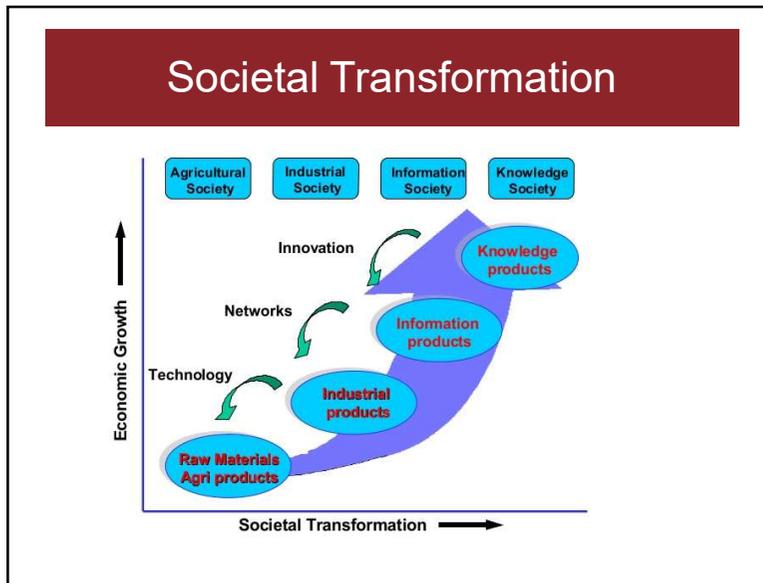

*“Knowledge is now
the infrastructure”*

**1 – About knowledge and the
knowledge society**

What is knowledge?

How can knowledge be an infrastructure for smart cities and territories?

Cake metaphor (Gurteen)

Data: molecular components
Information: ingredients
Knowledge: recipe (know-how)
Wisdom: choose to whom to make the cake (know-why)

Definition of Geographic Knowledge

Geographic knowledge corresponds to information potentially useful to

- explain,
- manage,
- monitor
- plan a territory
- and to innovate from another territory

2 – Smart cities and territorial intelligence

Dozens of definitions

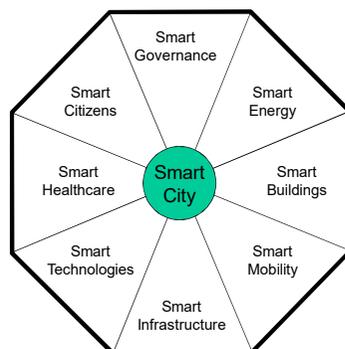

Only a few

Carlo Ratti's Definition

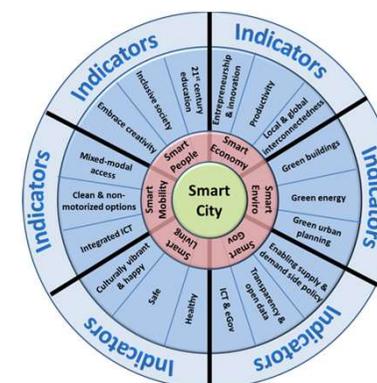

Dr. Carlo Ratti, director of the MIT Senseable City Lab, claims that an intelligent or smart city is technological, interconnected, clean, attractive, comforting, efficient, open, collaborative, creative, digital and green.

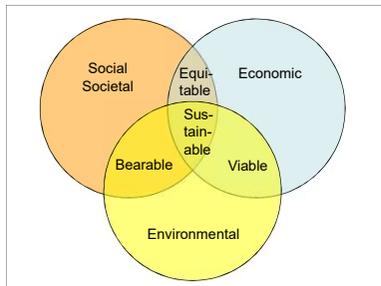

Mathew's diamond

Boyd Cohen's wheel

Pillars for territorial intelligence

Territorial Intelligence

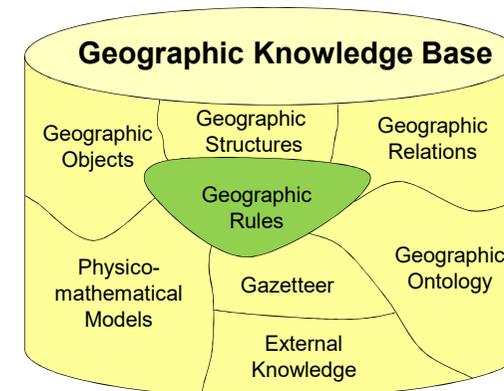

$$\begin{aligned}
 &\text{Territorial Intelligence} \\
 &= \\
 &(\text{Territory} \\
 &+ \\
 &\text{Collective Human Intelligence} \\
 &+ \\
 &\text{Artificial Intelligence}) \\
 &\rightarrow \text{Sustainable development)
 \end{aligned}$$

3 – Geographic knowledge for smart cities

- Description of the territory
- Description of its dynamics
- Description of projects

→ Projections for the future

GKB Components

Geographic Projects

Where to put a new airport, a new hospital, a new stadium, etc.?

Is this new construction project compliant with planning rules?

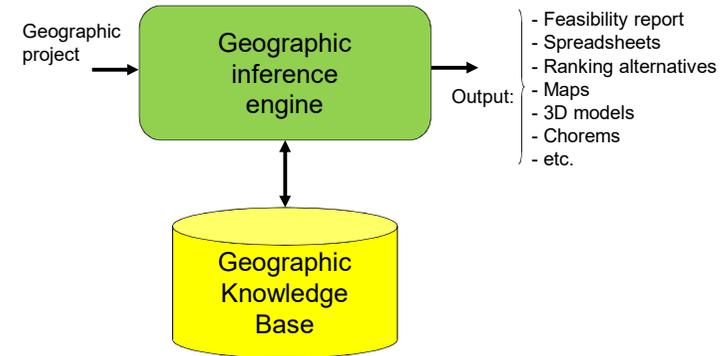

What is the best mode or the best way to get from *A* to *B*?

How to organize a plan for green spaces in a city?

How to reorganize common transportation?

etc.

Usage

4 – About geospatial rules

Rules must be considered as first-class citizens in IT (Graham, Morgan, Ross, etc.)

Generally, in business intelligence:

IF-THEN-fact

IF-THEN-Action

Encoded by means of logic

But for geospatial rules: geometry, topology, etc.

Examples of geospatial rules (1/2)

If a lane is narrow, make it one-way, except if it is a cul-de-sac (dead end);

When planning a metro, move underground networks;

No parking, no business;

Each building must be connected to utility networks (water, electricity, gaz, telephone, internet, etc.);

Council flats must be connected to urban heating systems;

If a cross-road is dangerous, install traffic lights;

In city centers, transform streets into pedestrian precincts;

When a commercial mall is planned in the neighborhood of a city, shops located in the city center will be in jeopardy;

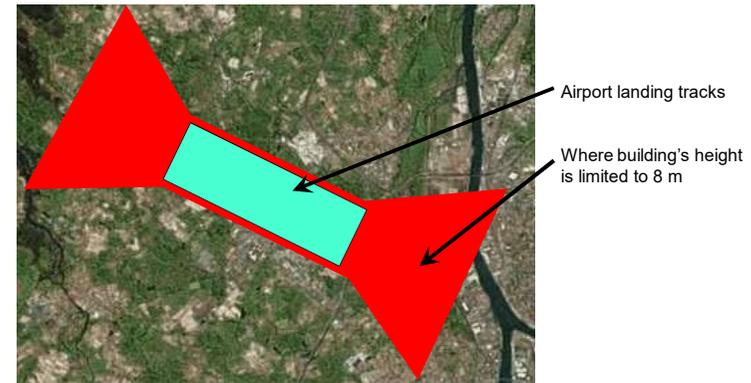

If the number of car parking lots is insufficient, encourage using buses or bikes;

At the vicinity of an airport, limit building heights

Examples of geospatial rules (2/2)

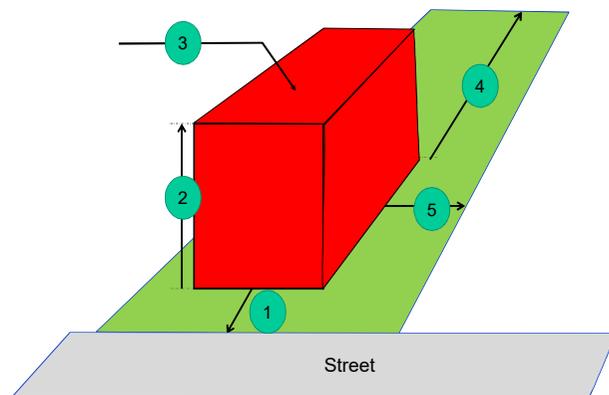

- When a big plant is closing, unemployment will increase;
- At the vicinity of an historic building, no modifications of building are allowed
- Every lamppost can be considered as holder of sensors (temperature, pollution, noise, etc.);
- When defining a new industrial area, unemployment will diminish;
- When a road is wide and buses are running, provide a bus lane;
- If a recreational park is inside a city, provide bike lanes coming to this park;
- In France, it is forbidden to open a new tobacconist shop within 500 meters from an existing one;
- If there is one or several rivers crossing a city, design systems to mitigate floods;
- In a city with many hills, consider cable-cars linking them.

Near airport

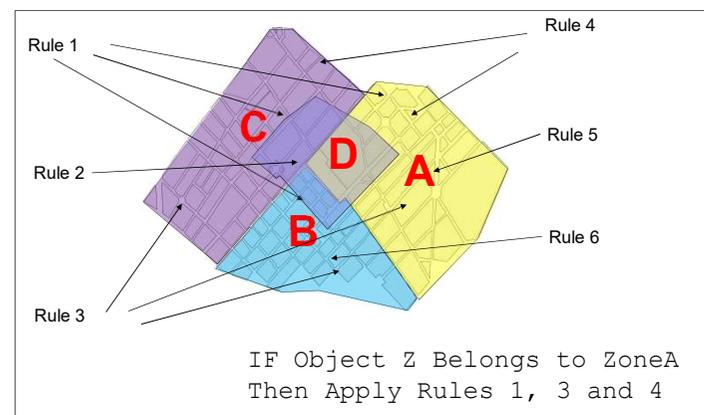

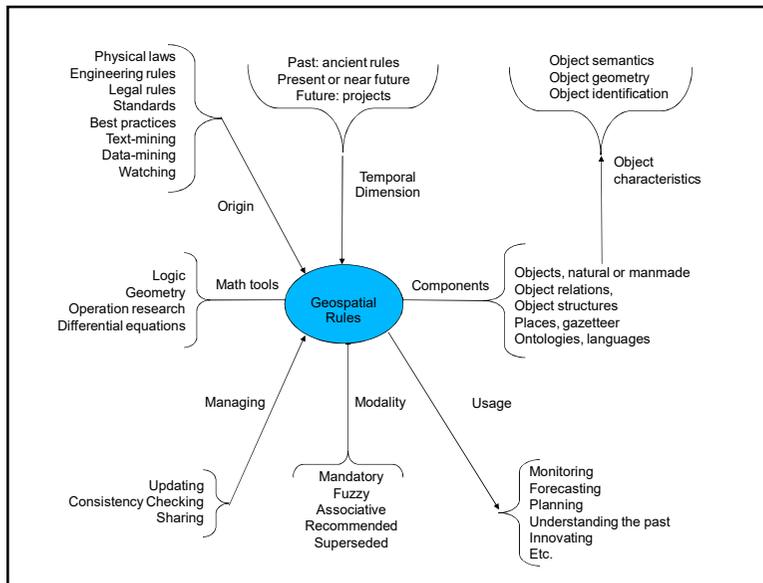

Polyg (150,2 240,151 470,268 670, 250 551,512 455,375 197,249 11,252)

Planning rules

Located rules

First typology of geospatial rules

Co-location rules: “if something here, then another thing nearby”

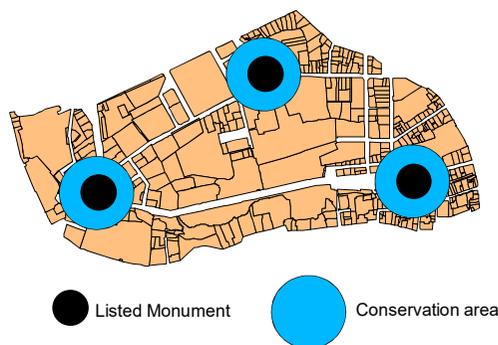

IF-THEN-Zone: for the creation of a zone

Metarule: “IF some conditions hold, THEN apply RuleA”

Located rule: “IF in a place B , THEN apply RuleB”;

Bi-location rule: “IF something holds in place P, then something else in place Q”

Listed historic monuments

Encoding

$$\forall T \in \text{Earth}, \forall B \in \text{PROJECT}, \exists M \in \text{Geo-Objects},$$

$$\Omega\text{-Type}(B) = \text{“Building”},$$

$$\Omega\text{-Type}(M) = \text{“Listed_Monument”},$$

$$\text{Inside}(\text{Geom}(B), T), \text{Inside}(\text{Geom}(M), T):$$

$$\text{Disjoint}(\text{Geom}(B), \text{Union}(\text{Buffer}(\text{Geom}(M), 100)))$$

$$\Rightarrow$$

$$\text{State}(B) = \text{“LM_Approved”}$$

5 – Geographic knowledge infrastructure

Existing Spatial Data Infrastructure (e. g. INSPIRE)

Data, metadata, information

Collected once

Seamless combination of various sources

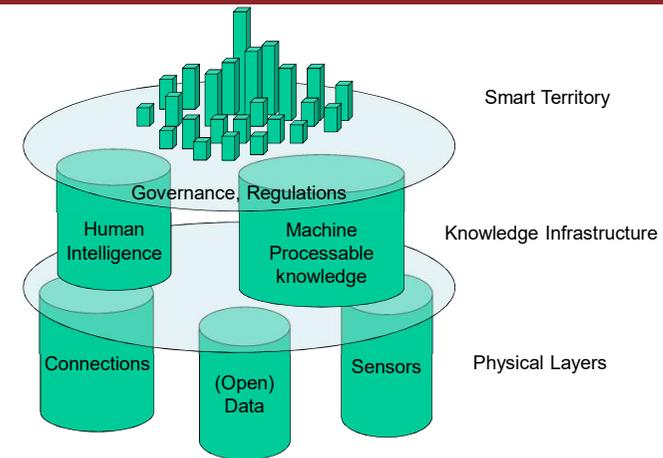

Availability

Conditions for acquisition/use

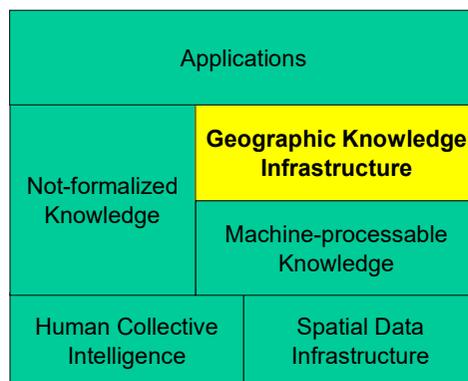

Knowledge infrastructure

Methodologies

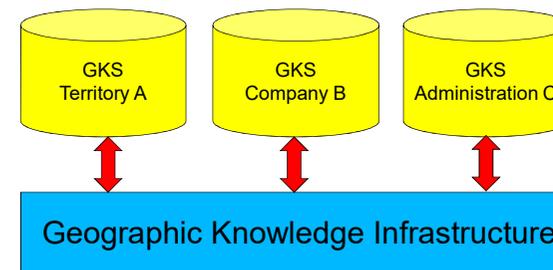

Role of knowledge infrastructure

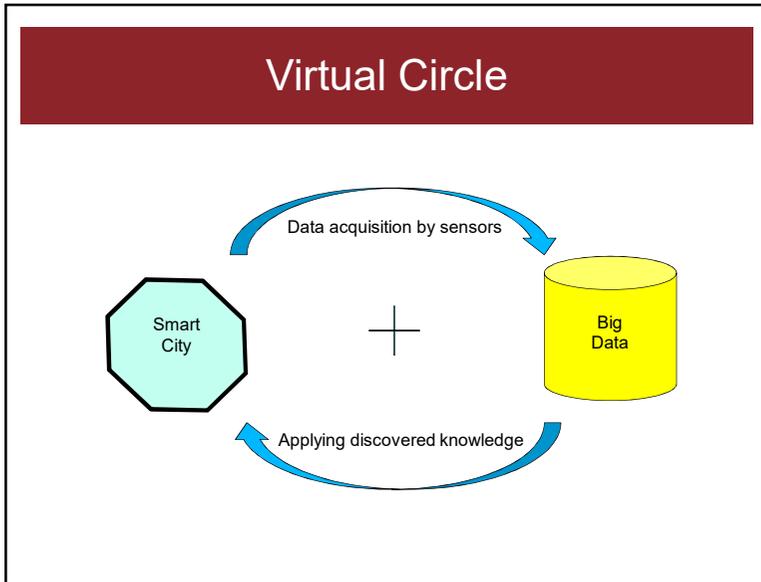

Geographic Knowledge Infrastructure

Sharing Knowledge Infrastructure

- ### 6 – Conclusion and research agenda (1/2)
- 1 – identification of knowledge chunks, including rules, and their characteristics,
 - 2 – identification of rule semantics (2D, 3D, 3D+T),
 - 3 – identifying a collection of examples for prototyping,
 - 4 – definition of a language for geospatial rules,
 - 5 – structuring and populating knowledge bases,
 - 6 – design of a language for modeling projects and scenarios as input,

- ### Conclusion and research agenda (2/2)
- 7 – identifying output representations suitable for all stakeholders,
 - 8 – primary specifications of a geographic inference engine,
 - 9 – implementation and execution of the engine,
 - 10 – integration of narrative and visual knowledge,
 - 11 – assessment of the result and possible modifications of the language or the engine,
 - 12 – definition of real-life examples,
 - 13 – acceptability by stakeholders.
